Ireland

Agenda

- Recent Mortality Experience in Ireland – Sinéad Carty
- International Mortality Developments – Caroline Twomey
- Irish Mortality Research – Dr Mary Hall

Total Deaths ages 18-102 in Ireland, 1985 -2016

1985 -1999

- Considerable year on year volatility
- Population steadily growing

1999-2006

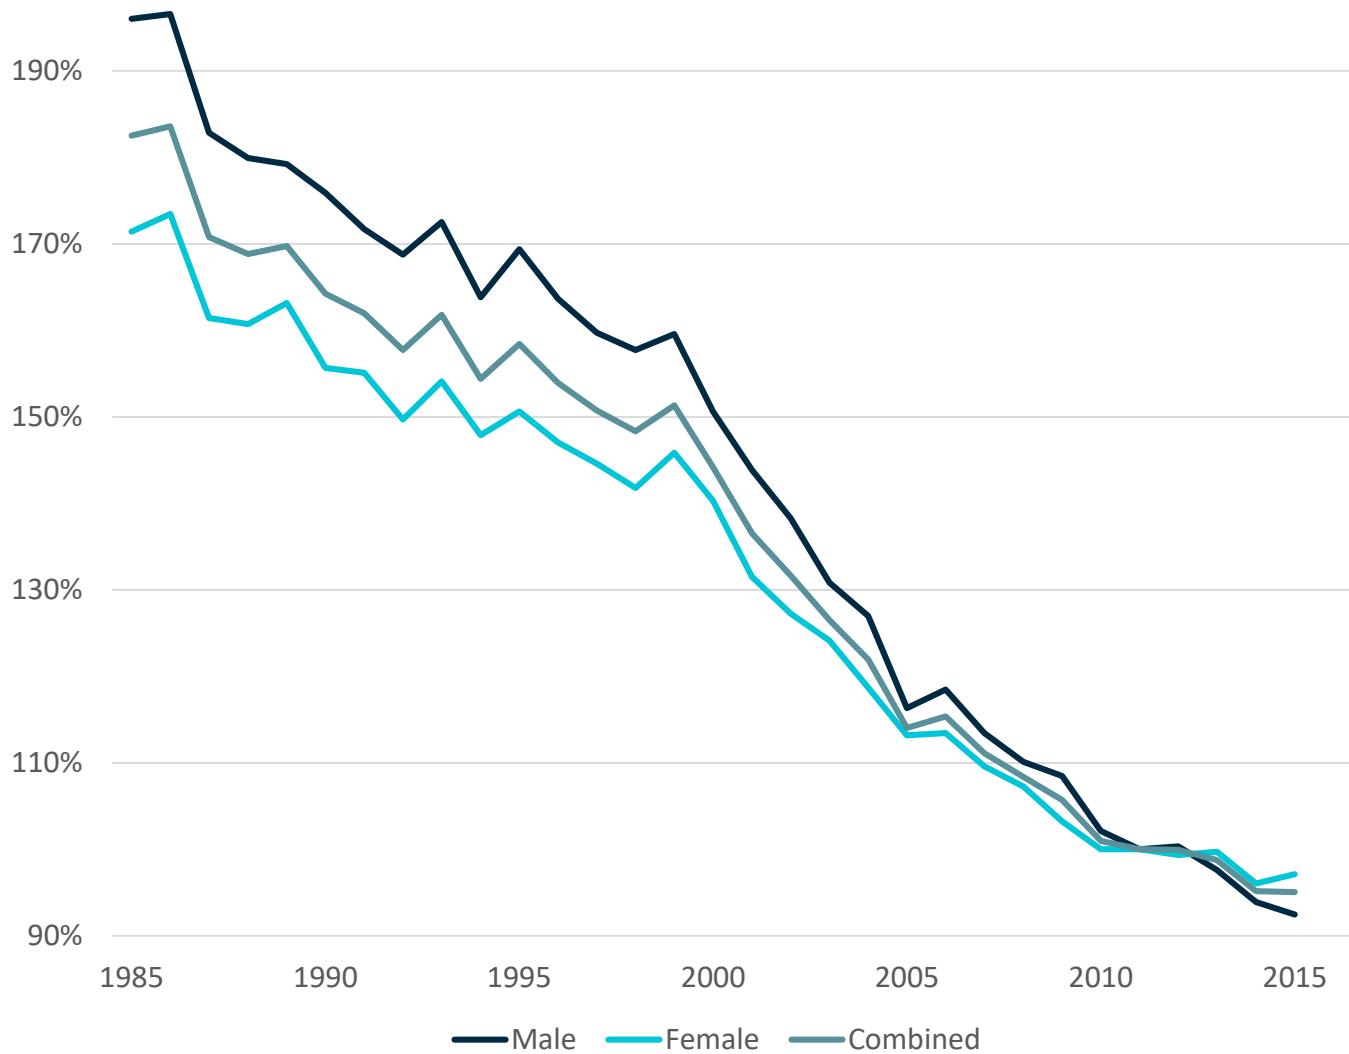

- Sharp decline in deaths with low volatility
- Population continues steady growth

2006-2015

- Volatility in year on year deaths, fairly steady increase from 2010
- Population growth slowing from 2010

Standard Mortality Ratios, 1985 -2015

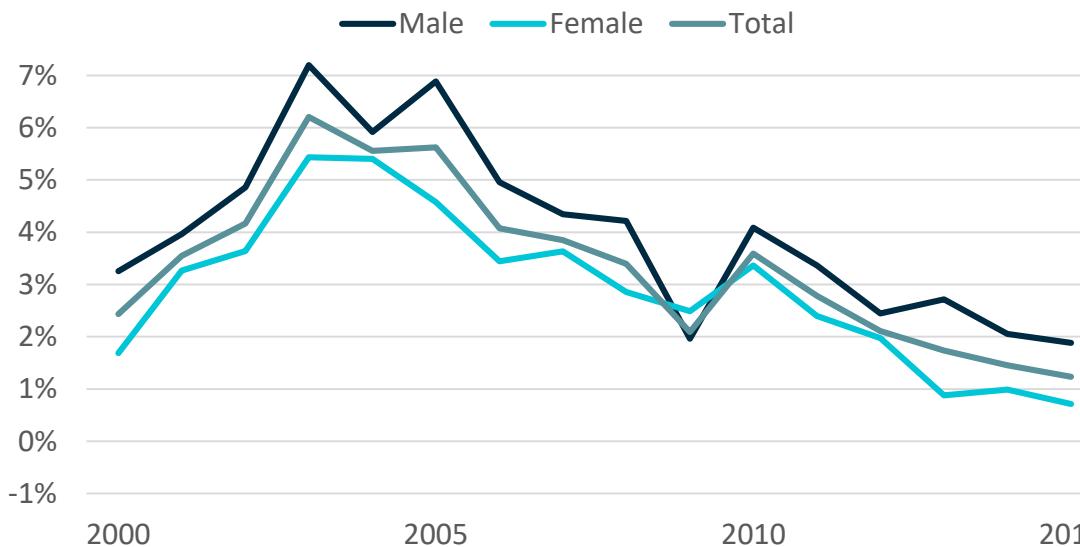

- Standard Mortality Ratios - a “model free” approach
- Reference point chosen as 2011
- Sharp steady decline mortality ratios during “Celtic Tiger years
- Some slowdown in decline in **male** ratios evident from 2010 onwards but improvements largely continue year on year
- Slowdown in decline in **female** mortality ratios clear. Improvements almost flat 2010-2014

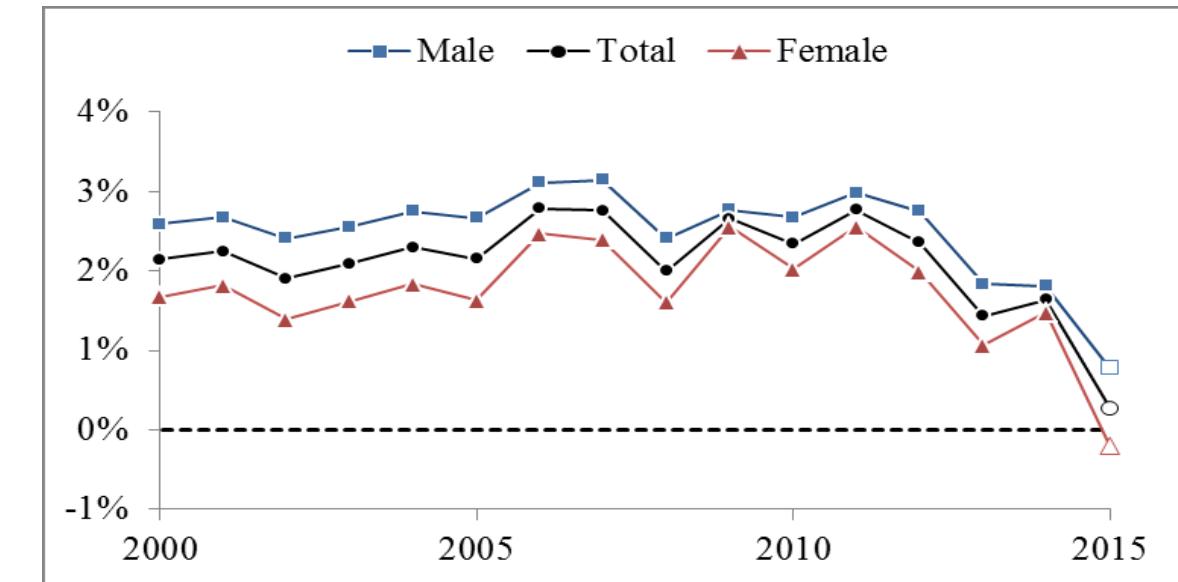

Annualised 4 year mortality improvements Ireland & UK 2000-2015

Ireland

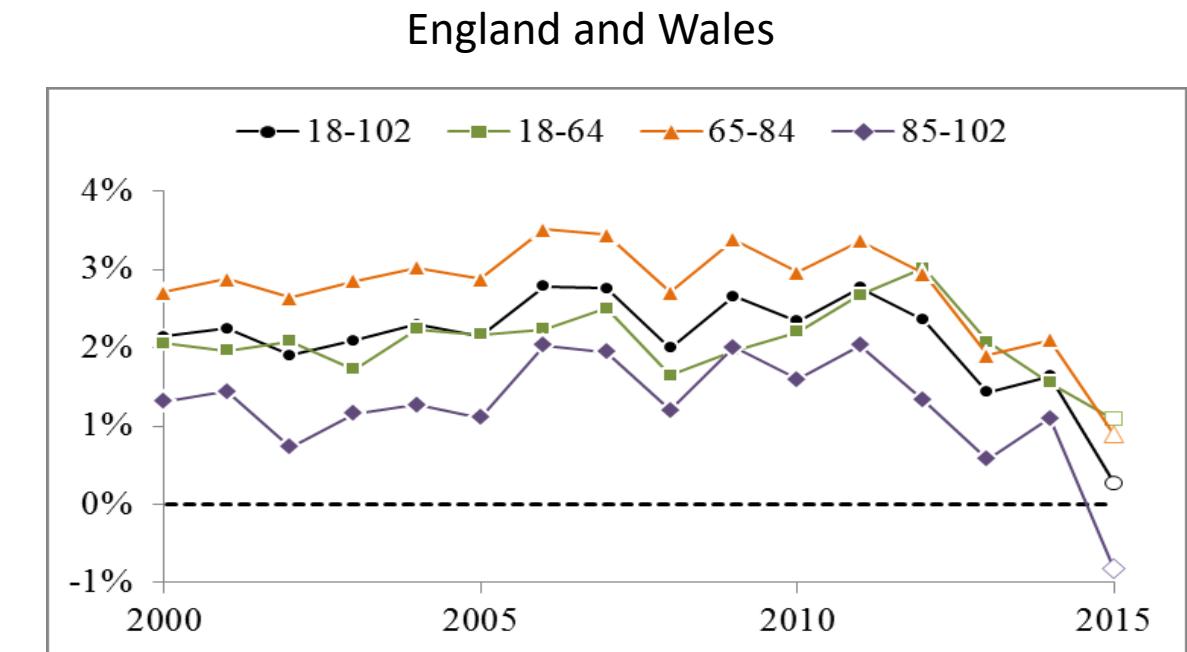

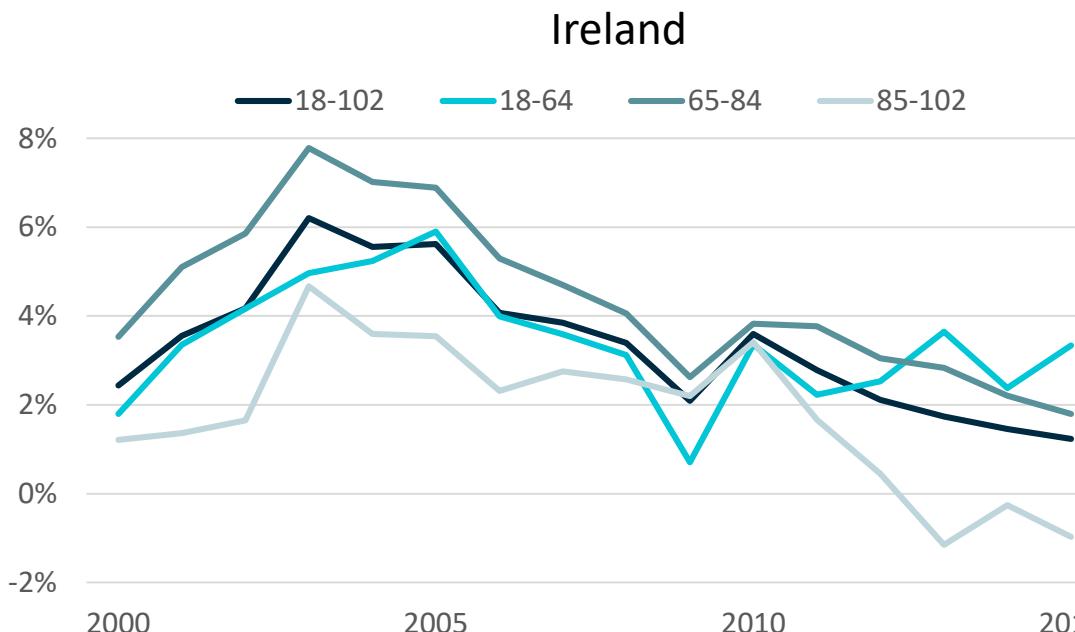

England and Wales

- Different trends apparent in Ireland and UK mortality improvements over the period
- 2000-2005: Impact of economic prosperity in Ireland evident in Ireland – level of improvements increasing rapidly and peaking at levels not evident in the UK
- 2005-2010: Return of improvements in Ireland to levels similar to UK
- 2010-2015: Clear reduction in level of improvements in both countries but pronounced in the UK.

Annualised 4 year mortality improvements by age, Ireland & UK

- Largest improvements experienced by the age group 65-84 in both Ireland and UK
- Age groups 65-84 and 85-102 tend to follow the same pattern. Ages 15-64 show different pattern
- Slow down in improvements from 2010 most apparent in oldest age group
- 2011- 2015 exceptionally low for UK , 0.3% pa average, 1.2% for Ireland

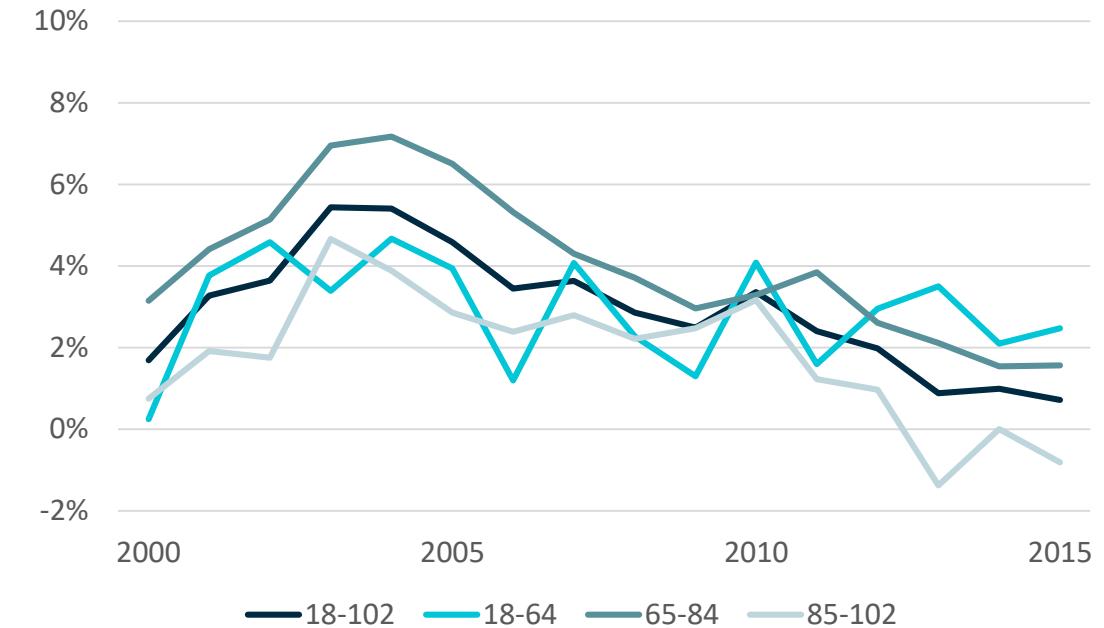

Annualised 4 year mortality improvements - Males & Females

Male Improvements by age group

Female Improvements by age Group

- Results more volatile when broken down by age
- In general females showing lower mortality improvements but pattern by age group similar for both male and females

Conclusions

- Marked slowdown in mortality improvements since 2010 in UK and Ireland
- On average slowdown more pronounced in UK than Ireland
- Age groups 65-84 and 85-102 most impacted by slow down in morality improvements
- Ages 85-102 - negative average mortality improvement from 2011-2015 in Ireland and UK
- Female improvements lower but pattern of slowdown similar for both males and female by age in Ireland
