## Capital Aggregation and

## Attribution

## Curt Burmeister

Vice President, Risk Solutions

## Copula Based Risk Aggregation

## Copula Based Risk Aggregation

## Copula Risk Aggregation Steps

1. Generate Correlated Market Risk Scenarios on IR Curves, EQ Indices, etc
2. Generate Correlated Non-Market Risk Scenarios on N(0,1) Risk Drivers
3. Value assets using market risk scenarios
4. Value non market risks using marginal risk distributions

## Scenarios are correlated $\Rightarrow$ values are additive

## Key Benefits

- Full drill down into Market Risk
- Hedge analysis
- Stress tests

## Scenario Generation

Capital Aggregation and Aggregation

## Concepts

## Aggregation Rules

- Determines how much capital each node can transfer to its parent node
- Examples include fungibility rules, caps on transfers, percentage ownership of subsidiary, tax considerations, etc.

## Transferable Capital

- The amount of capital for each business hierarchy child node can share with its parent node
- The transferable capital is aggregated up the business hierarchy to calculate SCR

## Concepts

Capital Attribution

- Allocation of capital down the reporting hierarchy from a parent node its children
- Aggregation rules are typical non-linear (max, min, etc)

Methods for Aggregation \& Attribution

- Quantile attribution - upper empirical cumulative distribution function value or UCEV (order statistic)
- Smoothed values - use an L-estimator such as Harrell-Davis weights
- Biting Scenario - use an L-estimator to smooth the risk factors to create a new scenario

## References for Harrell-Davis Weights

## Harrell-Davis Weights

## Case Study

Reporting hierarchy with four product lines

10,000 Monte Carlo scenarios

Aggregation Rules applied to NAV and Attribution applied to $\triangle N A V$
Limits applied to transferable capital up the hierarchy
Calculate SCR
1.Quantile
2.Use HD Weights as to smooth SCR values
3. Use HD Weights to smooth risk factors for biting scenario

Two alternative attribution methods using HD Weights:

1. Use HD Weights to smooth SCR values
2. Use HD Weights to smooth risk factors for biting scenario

## A Simple Reporting Hierarchy

## NAV Sorted by Group

| Order | Scenario | A | B | D | C | E | F | G | Group |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 45 | SSMC_5474 | 5.7471 | 28.3337 | 25.8269 | 8.5202 | 6.4567 | 3.7442 | 31.0991 | 8.7108 |
| 46 | SSMC_1594 | 6.6216 | 19.3178 | 28.9337 | 6.4848 | 7.2334 | 3.4296 | 31.4823 | 8.7280 |
| 47 | SSMC_824 | 7.4212 | 16.2818 | 30.5021 | 5.9258 | 7.6255 | 3.3878 | 31.5251 | 8.7282 |
| 48 | SSMC_5908 | 6.6182 | 22.3473 | 27.9640 | 7.2414 | 6.9910 | 3.5581 | 31.3725 | 8.7326 |
| 49 | SSMC_7811 | 5.3369 | 30.5722 | 25.1125 | 8.9773 | 6.2781 | 3.8138 | 31.1211 | 8.7337 |
| 50 | SSMC_5762 | 7.6980 | 11.2231 | 32.4361 | 4.7303 | 8.1090 | 3.2098 | 31.7287 | 8.7346 |
| 51 | SSMC_3041 | 6.6725 | 21.3790 | 28.2554 | 7.0129 | 7.0638 | 3.5192 | 31.4387 | 8.7395 |
| 52 | SSMC_1908 | 6.6234 | 22.7543 | 28.3017 | 7.3444 | 7.0754 | 3.6050 | 31.3536 | 8.7396 |
| 53 | SSMC_98 | 6.1500 | 25.1527 | 26.6300 | 7.8257 | 6.6575 | 3.6208 | 31.3915 | 8.7531 |
| 54 | SSMC_3487 | 5.4300 | 29.7629 | 25.5939 | 8.7982 | 6.3985 | 3.7992 | 31.2822 | 8.7703 |
| 55 | SSMC_5497 | 6.3882 | 24.4721 | 27.1761 | 7.7151 | 6.7940 | 3.6273 | 31.4636 | 8.7727 |

## NAVs for

|  | A | B | D | C | E | F | G | Group |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SSMC_7811 | 14 | 9981 | 21 | 9701 | 21 | 7281 | 38 | 49 |
| SSMC_5762 | 554 | 93 | 9791 | 42 | 9791 | 21 | 62 | 50 |
| SSMC_3041 | 120 | 8086 | 414 | 1711 | 414 | 509 | 48 | 51 |

## NAV for Group scenarios 49, 50, 51

- Good for diversification
- Hard to use for

|  | A | B | D | C | E | F | G | Group |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SSMC_7811 | 14 | 9981 | 21 | 9701 | 21 | 7281 | 38 | 49 |
| SSMC_5762 | 554 | 93 | 9791 | 42 | 9791 | 21 | 62 | 50 |
| SSMC_3041 | 120 | 8086 | 414 | 1711 | 414 | 509 | 48 | 51 |

## Aggregation Rules

| Node | $\boldsymbol{A}$ | $\boldsymbol{B}$ | D | C | $\boldsymbol{E}$ | $\boldsymbol{F}$ | G | Group |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Max <br> Transferable <br> Profit | 10 | 20 | 20 | 25 | 17 | 35 | 20 | None |
| \%Profit | $25 \%$ | $25 \%$ | $25 \%$ | $25 \%$ | $25 \%$ | $25 \%$ | $25 \%$ | None |
| \%Loss | $80 \%$ | $80 \%$ | $80 \%$ | $80 \%$ | $80 \%$ | $80 \%$ | $80 \%$ | None |

## Quantile Aggregations Calculations

For leaf nodes NAV for each scenario
value from asset and/or liability model

For aggregation nodes, NAV for each scenario

$$
N A V_{\text {Parent Node }}=\sum_{i=\text { Child Nodes }} T N A V_{i}
$$

For all nodes, TNAV for each scenario
aggregations rules applied to NAV

## Quantile Aggregations Calculations

## .995\% NAV (SCR)

1.Calculate the NAV for each of the Products for all 10,000 scenarios using valuation models
2.Sort the NAV from smallest to largest
3.Select scenario 50

## Quantile Aggregations Calculations

. 995\% TNAV (Transferable NAV)
1.Apply the aggregation rules to NAV for each of the 10,000 scenarios to calculate TNAV
2.Sort the TNAV from smallest to largest
3.Select scenario 50

## Quantile Aggregations Calculations

Compute NAV and TNAV for each of the aggregation nodes

$$
\text { 1. } \quad N A V^{\text {Scenario=S }}=\sum_{i=\text { Child Nodes }} T N A V_{i}^{S}
$$

2. Sort the NAV from smallest to largest
3. Select scenario 50 for $.995 \%$ NAV (SCR)
4. For each scenario apply aggregation rules to NAV to determine TNAV
5. Sort the TNAV from smallest to largest
6. Select scenario 50 for $.995 \%$ TNAV

## Quantile Aggregated NAV and TNAV

## HD Smoothed Aggregation Calculations

1. Order scenarios by Group
2. Calulate the HD Weights
3. $. \mathrm{SCR}=995 \% \mathrm{HD}$ NAV $=\sum_{10,000}^{s=1} H D W e i g h t_{s} * N A V_{s}$
4. $.995 \%$ HD TNAV $=\sum_{10,000}^{s=1} H D W e i g h t ~_{s} * T N A V_{s}$

## HD Smoothed Aggregated NAV and TNAV

## Comparing Quantile and HD SCR

| Node | A | B | D | C | E | F | G | Group |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Aggregated <br> Quantile SCR | 3.8462 | 10.2231 | 3.6978 | 2.6488 | 0.9244 | 0.4586 | 8.5233 | 2.2028 |
| Aggregated <br> HD SCR | 3.4986 | -2.3167 | 1.8357 | 0.2954 | 0.4589 | 0.1886 | 8.5781 | 2.1916 |

## Biting Scenario Calculations

1. Sort the Group NAV from smallest to largest
2. Apply HD Weights to the risk factor values in each scenario to compute a new biting scenario
3. Recalculate the NAV for the biting scenario
4. Calculate the TNAV for the biting scenario by applying the aggregation rules to the NAV

## Biting Scenario NAV and TNAV

## Comparing Quantile, HD, \& Biting Scenario SCR

| Node | A | B | D | C | E | F | G | Group |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Aggregated <br> Quantile SCR | 3.8462 | 10.2231 | 3.6978 | 2.6488 | 0.9244 | 0.4586 | 8.5233 | 2.2028 |
| Aggregated <br> HD SCR | 3.4986 | -2.3167 | 1.8357 | 0.2954 | 0.4589 | 0.1886 | 8.5781 | 2.1916 |
| Aggregated <br> Biting SCR | 3.4744 | -3.2502 | 2.3463 | 0.0560 | 0.5866 | 0.1607 | 8.6296 | 2.1976 |

## HD Attribution

Take advantage of the fact that $\quad N A V_{\text {Parent Node }}=\sum_{i=\text { Child Nodes }} T N A V_{i}$

Construct attribution weights $\quad w_{i=\text { Child Node }}=\frac{T N A V^{.995}{ }_{i}}{N A V^{.995}{ }_{\text {Parent Node }}}$

Attributed SCR $=w_{i} * \operatorname{SCR}_{\text {Parent Node }}^{H D}$

## Comparing Quantile, HD, \& Biting Scenario SCR
